

# Kindle 4 Screen Replacement

This is a screen replacement guide for a kindle 4 (D01100).

Written By: Francis Santens

## INTRODUCTION

The screen of this kindle 4 was broken. You could not see the break from the front, but half of the screen was frozen and did not work anymore. We ordered a new screen from [aliexpress](#)

### TOOLS:

- [Kitchen Knife](#) (1)

### PARTS:

- [New screen](#) (1)
- [optional: glue dissolvant solvent](#) (1)

## Step 1 — Remove the back cover

- Remove the back of the kindle.

- ⚠ The back is glued in the middle and attached with 2 pins at each side. The top and bottom pins slide in the frame, so if you pull too hard they might break.
- ⚠ Watch out for static electricity, it might destroy your device. Decharge before you start by holding a radiator or use a bracelet.
- Start with opening the back at the sides. Push your knife or tweezers in a bit deeper at the middle and twist them to push the glued cover part from the frame. Don't do this near the side buttons as you might cut the wire of the buttons.
- See [this video](#) from second 33 until 2:00. Do not follow it any further as you don't need every step from this this take apart guide to replace the screen!

## Step 2 — Disconnect screen

- Now the back side is open, disconnect the screen cable from the motherboard as is done in [this video](#) from 3:14 until 3:21. Again do not follow the next steps from the video as we don't need them to replace the screen.

## Step 3 — Remove front cover

- Remove the front cover as is shown in [this video](#) from 4:11 until 4:48
- Again do not follow the video any further as we do not need these steps to replace the screen

## Step 4 — Remove old screen

- i** The screen is glued to the bezel over the entire surface of the screen, so inevitably the screen will be broken in pieces when removing it from the bezel.
- Start from the sides and break off the screen piece by piece by pushing tweezers between the bezel and the screen. The glue loosens easier if you warm up the screen with a blow dryer.

## Step 5 — Remove the glue

- This is the most tedious step. Remove the glue and fine bits of glass sticking to the bezel. Not all glue has to be removed, but the glass has to be gone. You can scrape off the glue with a knife (razor blade is the most convenient, but a regular knife works as well) or use the help of some solvents.
- i** The picture shows the bezel before glue removal. I forgot to take one after.

## Step 6 — insert the new screen

- Put the new screen in place.
- Make sure the connector sticks through the bezel.
- Connect the connector to the motherboard
- Test the connection by turning the device on

## Step 7 — Put the back and front cover back in place

- Clip the front and back cover back in.

This guide will help you to disassemble your device, take out the old screen, replace it by a new and reassemble your device.
